

TL;DR — Stuck mid-tap? The app now has a proper [Help Centre](#). **More** → **Help** opens 7 how-to articles, grouped, searchable, offline-ready. Same content that used to be locked in WhatsApp PDFs, now findable in the app itself. Missing an article? Feedback tab · we'll add it.

► Where it lives

More tab → **Help** (icon: ). It sits alongside History, Cards, Pods, World Cup, Feedback and Admin — one tap from the bottom nav.

► What you see when you open it

HELP CENTRE

HOW-TO GUIDES

BASICS

Getting started, signing up, the essentials

Getting started
What the app does and the five main tabs

>

Signing up for a match
I'm In / Drop Out, deadlines, player tiers, kids

>

MATCH NIGHT

Voting, formations, notifications

Voting for MOTM & DOTD
How the ballot works, streaks, results

>

Setting up notifications
iPhone & Android setup, troubleshooting

>

Team formations & tactics
The pitch card on the Match tab

>

WORLD CUP

Predictor scoring and sweepstake rules

Cup Predictor scoring
1 point for right team, +1 for right method

>

MONEY

Fees, fines, credits, blocks

Fees, fines & credits
WTP charges, fines, credits, grace period

>

Four categories, seven articles at launch. Category ordering is fixed (Basics → Match night → World Cup → Money); articles inside each keep the roughly "you'll need this first" order.

► Search

Type anything into the box at the top: it fuzzy-matches against **title**, **blurb**, and **the full article body**. So "grace period" finds Fees & credits, "APN" finds the Notifications article's troubleshooting section, "clean sheet" finds nothing (yet — that's the GK card article on the backlog).

Offline-ready. Articles ship **inside the app bundle** — not fetched at runtime. Once the service worker has cached the app, the Help Centre works on the tube with no signal. No spinners, no "failed to load".

► What an article looks like

← [HELP CENTRE](#)

Setting up notifications

Get a push on your phone when the MOTM/DOTD vote opens on Thursday night. Once you've enabled it, no more scrolling WhatsApp to find the ballot link — the app taps you on the shoulder.

► On iPhone

iOS only allows web push from apps you've added to the Home Screen. Two-step setup:

- In Safari, tap the **Share** icon → **Add to Home Screen**.
- Open the app **from the Home Screen** (the new icon, not Safari). Go to **Profile** → **Enable notifications**. Allow when prompted.

► On Android

Works from Chrome directly — no Home Screen step needed. **Profile** → **Enable notifications** → **Allow**.

Same teletext styling as the rest of the app — **yellow** for emphasis, **cyan** for links/pointers, green mono for anything the app displays or you'd type. Tables, lists, code blocks are all styled inline; every article ends with the same "Anything wrong? Ping admin via Feedback" footer.

► Missing an article? The feedback loop

► IF YOU SEE A GAP

Search comes up empty → tap **Feedback** at the bottom of the Help index (or in the More menu). Type what you were looking for.

■ WHAT HAPPENS NEXT

Admin gets the ping. New articles land in the next app deploy as .md files — same cycle as adding a new feature. No spreadsheet, no CMS.

► What hasn't changed

- The **18 primer PDFs** in the WhatsApp group aren't going away — they're the shareable-outside-the-app version. The Help Centre is the "I'm in the app right now and stuck" companion.
- The Feedback tab still works the same way — just now with a natural entry point from the help pages.
- Every existing feature still lives where it always did; the Help articles point at them, they don't hide them.

► Under the hood (one paragraph)

Articles live as markdown files in `src/help/*.md`. They're imported at build time via Vite's `?raw` suffix so the strings ship in the JS bundle — no runtime fetch, no failure modes, works offline. To add or edit an article, drop/edit a `.md` file and register it in `src/help/index.ts`. Ship on the next merge.

► Coming next

- **Contextual help** — a small `?` next to feature tiles (voting card, formation picker, Cup pick) linking straight into the relevant article, so you never have to leave what you're doing.
- **Article feedback** (`/`) — one-tap "was this useful?" at the foot of each article. Admin sees the ratio; articles with a bad ratio get rewritten first.
- **First-login tour** — new fellas get a two-minute walkthrough of the five tabs, ending on the Help Centre, so they know where to come back to.
- **More articles** — GK cards, admin functions (fine entry, WTP overrides), fitness sync (once anyone actually uses it). Send suggestions via Feedback.

Force-refresh the app · **More** → **Help** · have a browse.
Gap in the coverage? Feedback tab → done.
